# CS 316 (Kong): TinyJ Assignment 1

To be submitted <u>no later than</u>: Tuesday, April 30. [Note: I expect euclid to be up until midnight that evening, but there is no guarantee that it will be: If euclid unexpectedly goes down after 6 p.m., the deadline will **not** be extended. If you try to submit after 6 p.m. that evening and find that euclid is down, it might not be up again before midnight, in which case you will have to make a **late** submission!] This assignment counts 1.5% towards your grade.

The TinyJ language is an extremely small subset of Java. Every valid TinyJ program is a valid Java program, and has the same semantics whether it is regarded as a TinyJ or a Java program. The syntax of TinyJ is given by the following EBNF rules: A Java program is a TinyJ program if and only if it can be generated by these EBNF rules, except that TinyJ doesn't support method name overloading, program arguments, "return;" statements within the main() method, and into that are  $\geq 2^{31}-2^{16}=2,147,418,112$ . Reserved words of TinyJ are shown in boldface. Some names used by Java library packages, classes, and predefined methods (e.g., java, Scanner, main, and nextInt) are reserved words of TinyJ. Otherwise, IDENTIFIER here means any Java identifier consisting of ASCII characters.

```
::=
cprogram>
                                 <mainDecl> {<methodDecl>} '}'
                             import java . util . Scanner ;
<importStmt>
<dataFieldDecl>
                             static <varDecl>
                       ::=
                             int <singleVarDecl> { , <singleVarDecl>} ;
<varDecl>
                       ::=
                              Scanner IDENTIFIER = new Scanner '(' System . in ')';
                             IDENTIFIER \{ '['']' \} [ = <expr3> ]
                       ::=
<singleVarDecl>
                             public static void main '(' String IDENTIFIER '[' ']' ')'
<mainDecl>
                       ::=
                                <compoundStmt>
                             static ( void | int { '[' ']' } ) IDENTIFIER
    '(' <parameterDeclList> ')' <compoundStmt>
                       ::=
<methodDecl>
                              [<parameterDecl> { , <parameterDecl> }]
<parameterDeclList>
                       ::=
                              {	t int } <code>IDENTIFIER</code> {	t \{'[' \ ']'\}}
<parameterDecl>
                       ::=
                              ::=
<compoundStmt>
                       ::=
                              ; return [<expr3>]; | <varDecl> | <assignmentOrInvoc>
<statement>
                             <compoundStmt> | <ifStmt> | <whileStmt> | <outputStmt>
                             IDENTIFIER ( \{ '['<expr3>']' \} = <expr3> ; | <argumentList> ; )
                       ::=
<assignmentOrInvoc>
                              '('[<expr3>{,<expr3>}]')'
                       ::=
<argumentList>
                       ::=
                             if '(' <expr7> ')' <statement> [else <statement>]
<ifStmt>
                             while '(' <expr7> ')' <statement>
                       ::=
<whileStmt>
<outputStmt>
                       ::=
                             System . out . ( print '(' <printArgument> ')';
                                               println '(' [<printArgument>] ')';
                             CHARSTRING | <expr3>
<printArgument>
                       ::=
                             <expr6> { '|' <expr6> }
                       ::=
<expr7>
                             <expr5> { & <expr5> }
                       ::=
<expr6>
                             <expr4> { (== | !=) <expr4> }
<expr5>
                       ::=
                             <expr3> [(> | < | >= | <=) <expr3> ]
<expr4>
                             <expr2> { (+ | -) <expr2> }
<expr3>
                             <expr1> { (* | / | %) <expr1> }
<expr2>
                             '(' <expr7> ')' | (+ | - |!) <expr1> | UNSIGNEDINT | null
<expr1>
                             new int '[' <expr3> ']' { '[' ']' }
                              IDENTIFIER ( . nextInt '(' ')' | [ <argumentList>] { '[' <expr3> ']' } )
```

This is the first of three TinyJ assignments. After completing all three assignments you will have a program that can compile any TinyJ program into a simple virtual machine code, and then execute the virtual machine code it has generated. (Execution should produce the same run-time behavior as you would get if you compiled the same TinyJ program using javac into a .class file and then executed that .class file using a Java VM.) There will be exam questions relating to the TinyJ assignments, which may count 25 - 50% towards your grade.

**TinyJ Assignment 1** will not deal with compilation of TinyJ programs, nor with execution of virtual machine code, but only with *syntax analysis* of TinyJ programs. The goal of TinyJ Assignment 1 is to complete a program that will:

- (b) output a parse tree of the input file, if the input file is a cprogram>.

Regarding (a), note that a program> is a *syntactically* valid TinyJ program, but may contain errors like "undeclared variable" or "array index out of range". A "sideways" representation of ordered trees, described below, will be used for (b).

## A Sideways Representation of an Ordered Rooted Tree T

```
If T has just one node, then Otherwise, representation of T = the unique node of T representation of T = the root of T representation of the 1^{\rm st} subtree of the root of T representation of the 2^{\rm nd} subtree of the root of T ... representation of the last subtree of the root of T ... node has no more children
```

In this sideways representation, sibling nodes always have the *same* indentation, but each non-root node is further indented than its parent; *the indentation of a node is proportional to the depth of that node in the tree*. Here are the "ordinary" and the "sideways" representations of a tree:

```
<expr4>
                                          <expr3>
           <expr3>
                                           <expr2>
                                            <expr1>
                                            ... node has no more children
                                           ... node has no more children
                        <expr1>
 <expr1>
              <expr1>
UNSIGNEDINT IDENTIFIER UNSIGNEDINT
                                           <expr2>
                                            <expr1>
                                            IDENTIFIER
                                            ... node has no more children
                                            UNSIGNEDINT
                                             ... node has no more children
                                            ... node has no more children
                                           ... node has no more children
                                          ... node has no more children
```

#### How to Install the TinyJ Assignment 1 Files on euclid, venus, and Your PC

Do 1-5, and optionally 6-11, before our class on **Wednesday**, **April 17**. (See *Seven Files You Should Print Out* on p. 3.) Remember that Unix/Linux file and command names are *case-sensitive* when following the instructions below!

- 1. Login to euclid and enter: /users/kong300/316/TJ1setup [The 1 in TJ1setup is the digit 1, not the letter 1.]
- 2. Wait for the line "TJ1setup done" to appear on the screen, and then enter the following command on euclid: java -cp TJ1solclasses:. TJ1asn.TJ CS316ex12.java 12.sol
  Note the <u>period</u> after the colon in this command. This command executes my solution to this assignment with CS316ex12.java as the input file and 12.sol as the output file. A listing of CS316ex12.java should be displayed on the screen, and 12.sol should contain a sideways representation of the program's parse tree afterwards. <a href="Three should not be any error message">Three should not be any error message</a>. To view the tree, you can use less 12.sol or just open 12.sol in an editor.
- 3. Logout from euclid and login to venus.
- 4. Enter the following on *venus*: /home/faculty/ykong/TJ1setup [Again, the 1 in TJ1setup is the *digit* 1, not the letter 1.]
- 5. Repeat step 2 above on venus.

The following 6 steps are needed *only if* you are interested in doing TinyJ assignments on your PC rather than euclid or venus. (Regardless of where you do your work, you must submit on *euclid*.) These instructions assume you are using Oracle's JDK.

- 6. In a **cmd.exe** (command prompt) window\* on your PC, enter the following: **md** c:\316java
  - \*You can open a **cmd.exe** window on your Windows PC as follows:
    - 1. Type Win-r (i.e., hold down the Windows key and type r) to open the Run dialog box. 2. Type cmd into the Open: textbox and press em.
- 7. Enter javac -version in the cmd.exe window. If you get an error message or if the version number that is printed is older than 1.6, then download and install a newer version of the Java JDK (e.g., the Java SE 7u17 JDK) from the URL http://www.oracle.com/technetwork/java/javase/downloads/index.html and also set the PATH as explained at http://docs.oracle.com/javase/7/docs/webnotes/install/windows/jdk-installation-windows.html#path If you have difficulty with step 1 of these instructions for setting the PATH, try the following instead of that step:
  - 1. Type Win-r to open the Run dialog box. 2. Type control sysdm. cpl into the Open: textbox and press 🗐.
- 8. Make c:\316java your working directory by entering the following in the cmd.exe window: cd /d c:\316java
- 9. Using an scp or sftp client, download TJlasn.jar from your home directory on venus or euclid into the c:\316java folder on your PC. For example, if the PuTTY programs have been installed into the c:\Program Files\PuTTY folder on a PC running a 32-bit version of Windows, or the c:\program files (x86)\PuTTY folder on a PC running a 64-bit version of Windows (which can be done, e.g., by downloading the file putty-0.62-installer.exe from http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html and running that installer), and assuming c:\316 java is your working directory in the cmd.exe window (see step 8), when you are connected to the Internet you can download **TJlasn.jar** by entering the appropriate one of the following in the **cmd.exe** window:
  - "c:\program files\putty\pscp" xxxxx316@euclid.cs.qc.cuny.edu:TJ1asn.jar "c:\program files (x86)\putty\pscp" xxxxx316@euclid.cs.qc.cuny.edu:TJlasn.jar Here xxxxx316 means your euclid username. Note the <u>double quotes</u> in "c:\program ... pscp" and the space followed by a period at the end of the line! [Alternatively, you can logon to euclid and send TJlasn.jar to yourself as an e-mail attachment by entering the following on euclid: pine -attach TJlasn.jar your-email-address After pine starts up, enter [ x y to send the file. If you use this method, you will need to save the attached file (i.e., the file TJlasn.jar) into the C:\316java directory on your PC.]
- 10. Enter the following *two* commands in the **cmd.exe** window: jar xvf TJlasn.jar javac -cp . TJlasn\TJ.java
- 11. Enter the following command in the **cmd.exe** window:

java -cp TJ1solclasses;. TJ1asn.TJ CS316ex12.java 12.sol

The comments on step 2 also apply here, except that a semicolon rather than a colon precedes the period. A version of less for Windows PCs is available at: http://gnuwin32.sourceforge.net/packages/less.htm

#### Seven Files You Should Print Out and Bring to Class Starting on Wednesday, April 17

From your TJ1asn directory on euclid, bring printouts of:

Parser.java.txt OutputFileHandler.java.txt SourceFileErrorException.java.txt TJ.java.txt From your TJlexer directory on euclid (the 1 in TJlexer is the *letter* 1, not the digit 1), bring printouts of: LexicalAnalyzer.java.txt SourceHandler.java.txt Symbols.java.txt

These are the source files of the program, with **line numbers added**. The actual source files (without line numbers) are in the same directories and have the same names, but their extension is . java. If you have done steps 6 - 11 above, you can find the same files in C:\316java\TJ1asn and C:\316java\TJ1exer on your PC, and these files can be opened using, e.g., any of the editors recommended in the last paragraph of p. 4 of the handout for Lisp Assignment 2. Otherwise, you can e-mail the files to yourself—e.g., you can send TJlasn/TJ.java.txt to yourself by entering the following on euclid: pine -attach TJlasn/TJ.java.txt your-email-address [After pine starts up, enter  $\mathbb{C}^{\mathbb{R}} \times \vee$  to send the file.]

Note: Symbols.java is an Enum type. You should be familiar with C++ enum types. Java Enum types are rather more powerful—see, e.g., http://download.oracle.com/javase/1.5.0/docs/guide/language/enums.html

## How to Execute My Solution to This Assignment

Steps 1 and 4 put 16 files named CS316exk. java (k = 0 - 15) into your home directories on *euclid* and *venus*. These are all valid TinyJ source files. If you did step 10, it will have put copies of the same 16 files on your PC. You should be able execute my solution to this assignment either on euclid or on venus by typing:

java -cp TJ1solclasses:. TJ1asn.TJ TinyJ-source-file-name output-file-name [Your current working directory has to be your home directory for this to work.] This should also work in a cmd.exe window on your PC if you have done steps 6 – 11, except that you need a semicolon instead of a colon after TJ1solclasses on a PC:

java -cp TJ1solclasses; TJ1asn.TJ TinyJ-source-file-name output-file-name [Your working directory has to be C:\316 java for this to work (see step 8).]

#### How to Do TinyJ Assignment 1

The file TJlasn/Parser. java is incomplete. It was produced by taking a complete version of that file and replacing parts of the code with comments of the following two forms:

```
/* ??????? */ or (in two places) /* ????????? default: throw ...
```

To complete this assignment, replace every such comment in TJlasn/Parser.java with appropriate code, and recompile the file. On venus or euclid, you can use any text editor to edit the file. If you are working on your PC, do <u>not</u> use Notepad as your editor; I suggest you <u>use one of the editors listed in the last paragraph on p. 4 of the handout for Lisp Assignment 2</u>. (For the second type of comment, the appropriate code should include the default: throw ... statement.)

Do not put Parser.java or Parser.class into any directory other than TJlasn. Do not change or move other .java and .class files.

To recompile TJlasn/Parser. java after editing it, enter the following command in a cmd.exe window:

```
javac -cp . TJlasn/Parser.java
```

IMPORTANT: If you are doing this on *venus* or *euclid*, your current working directory has to be your home directory. If you are doing this on your PC (in a **cmd.exe** window), your working directory has to be **c:\316java** (see installation step 8); otherwise javac will not be able to find other classes that are used in Parser.java!

As stated on p. 3 of the first-day handout, keep backups of your edited versions of Parser. java on venus and elsewhere.

#### **How to Test Your Solution**

Test your completed program by executing it with each of the 16 files CS316exk. java (k = 0 - 15) as the TinyJ source file, and k. out as the output file. You can do this as follows:

```
java -cp . TJ1asn.TJ CS316exk.java k.out
```

If you are doing this on *venus* or *euclid*, your current working directory has to be your home directory. If you are doing this on your PC (in a **cmd.exe** window), your working directory has to be **c:\316java** (see installation step 8).

If your program is correct then in each case the output file k. out should be identical to the output file k. sol that is produced by running my solution with the same source file as follows:

```
java -cp TJ1solclasses:. TJ1asn.TJ CS316exk.java k.sol [on euclid or venus] java -cp TJ1solclasses;. TJ1asn.TJ CS316exk.java k.sol [on a PC]
```

On *euclid* and *venus*, use diff -c to compare the output files produced by your and my solutions. (This outputs a report of the differences, if any, between the two files.) On a PC, use fc / n to compare files. For example, the commands diff -c k.sol k.out > k.dif [on venus or euclid] and fc / n k.sol k.out > k.dif [on a PC] output to k.dif the differences between k.sol and k.out. (If your solution is correct, there should be no differences.)

## How to Submit a Solution to This Assignment

This assignment is to be submitted *no later than* **Tuesday, April 30**. It counts 1.5% towards your grade. [**Note**: If **euclid** unexpectedly goes down after 6 p.m. on the due date, the deadline will *not* be extended. Try to submit no later than noon that day, and on an earlier day if possible.] To submit:

- 1. Add a comment at the beginning of your completed version of Parser. java that gives your name and the names of the students you worked with (if any). As usual, you may work with up to two other students.
- 2. Leave your final version of Parser.java on *euclid* in your TJ1asn directory, so it replaces the original version of Parser.java, before midnight on the due date. When two or three students work together, *each* of the students must leave the completed file in his/her directory. If you are working on venus or your PC, you can transfer Parser.java to your TJ1asn directory on euclid by following the instructions on the next page.
- 3. Be sure to test your submission on euclid. Note that if your modified version of Parser.java cannot even be compiled without error on *euclid*, then you will receive no credit at all for your submission!

IMPORTANT: Do NOT open your submitted file Parser. java in an editor on euclid after the due date, unless you are resubmitting a corrected version of your solution as a *late* submission.

## How to Transfer TJ1asn/Parser.java from venus or a PC to euclid's TJ1asn Directory

The following instructions assume that **xxxxx316** is your username on **euclid**.

If you are working on **venus**, and your current working directory is your home directory, enter the following command to transfer **TJlasn/Parser.java** to your **TJlasn** directory on **euclid**: **scp TJlasn/Parser.java xxxxx316@euclid.cs.qc.edu:TJlasn**You will be asked to enter your euclid password.

If you are working on a PC that is running a 32-bit version of Windows and the PuTTY programs\* have been installed into the c:\Program Files\PuTTY folder, or you are working on a PC that is running a 64-bit version of Windows and the PuTTY programs have been installed into the c:\Program Files (x86)\PuTTY folder, then you can transfer TJlasn/Parser.java into your TJlasn directory on euclid by entering the appropriate one of the following commands in a cmd.exe window:

#### 32-bit Windows:

"c:\program files\putty\pscp" TJ1asn/Parser.java xxxxx316@euclid.cs.qc.edu:TJ1asn

## 64-bit Windows:

"c:\program files (x86)\putty\pscp" TJlasn/Parser.java xxxxx316@euclid.cs.qc.edu:TJlasn

The double quotes and the backslashes in "c:\program ... pscp" are needed! You will be asked to enter your euclid password.

<sup>\*</sup>You can get the PuTTY programs by downloading the installer file **putty-0.62-installer.exe** from <a href="http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html">http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html</a> and then running this installer on your PC.
